

# Light box screen film process

## Preparation

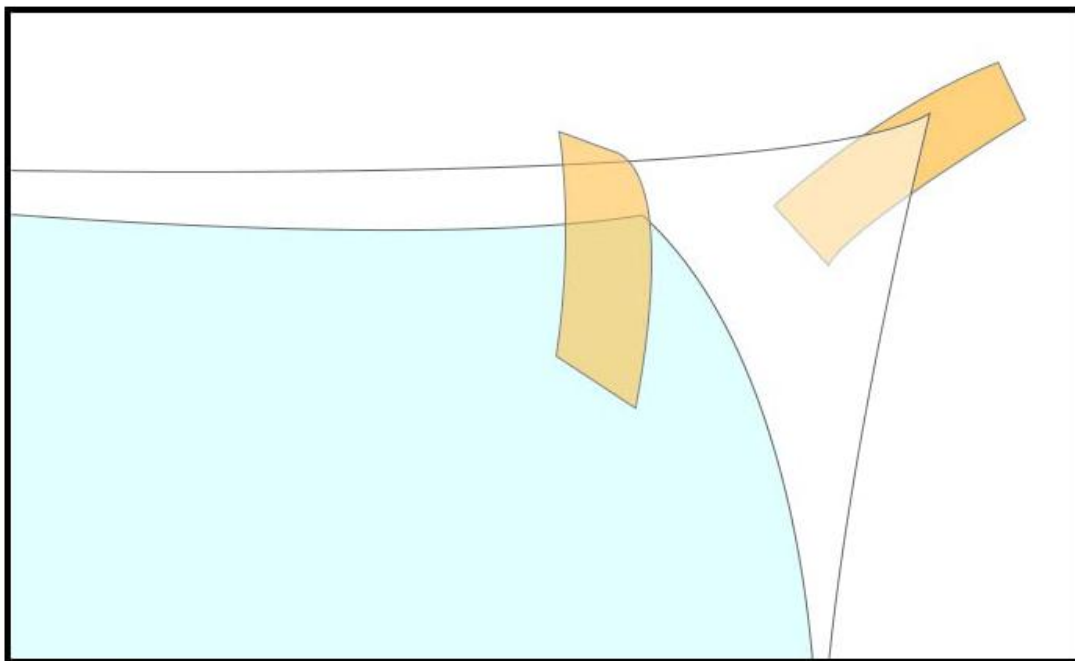

1. Clean the light box surface:Wipe the surface with a clean cloth dampened with water or cleaner to ensure it is free of dust.
2. Check the water transfer film:Ensure the film is intact and properly sized.Trim if necessary.
3. Prepare tools:Have a spray bottle(filled with water), scraper, towel or sponge,and utility knife ready.

## Application Process

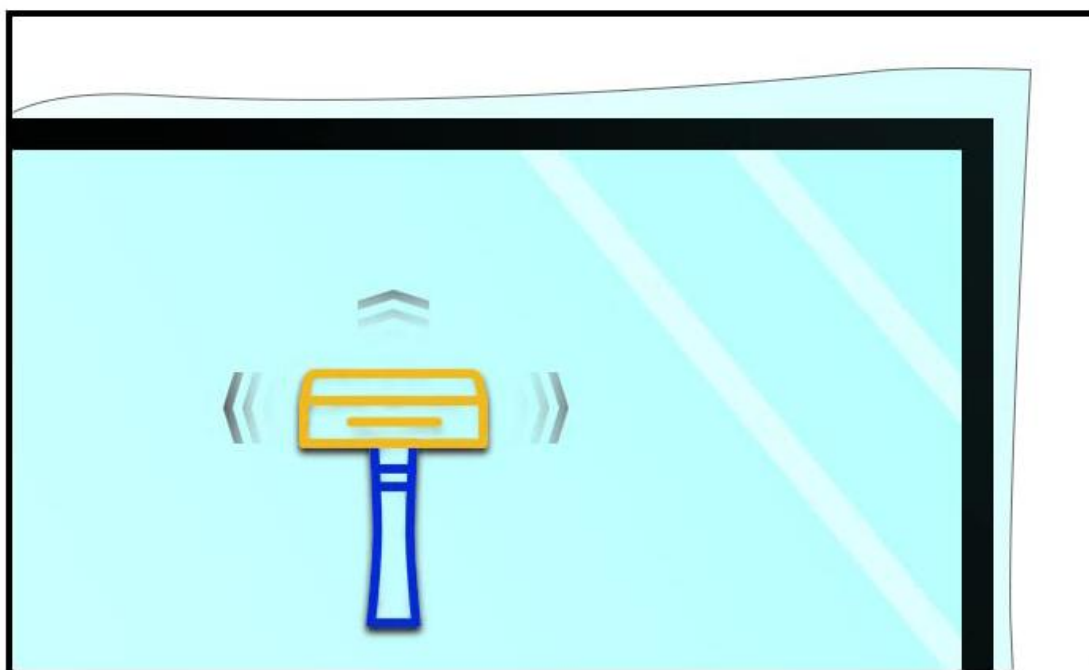

1. Moisten the light box:Spray the surface of the light box with water to create a thin film.

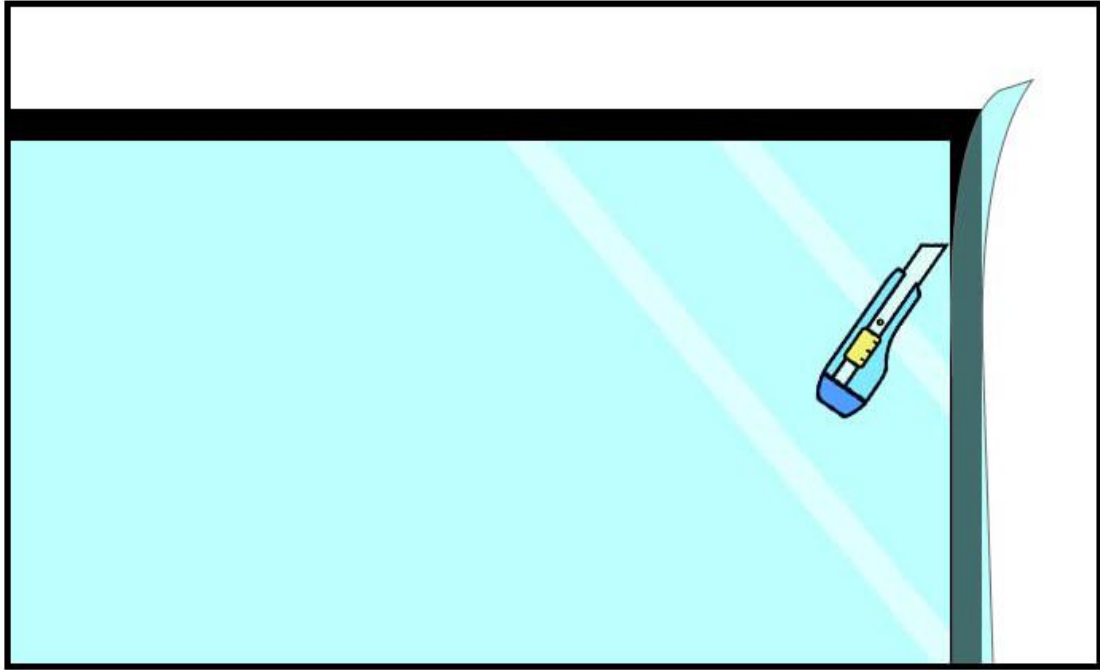

2. Peel off the backing:Carefully peel off part of the backing from the water transfer film and align it with the light box surface.

3. Apply the film: Start from one end and use the scraper to smooth out the film, removing any bubbles and ensuring a tight bond.

4. Trim excess: Use a utility knife to cut away any excess film that extends beyond the light box surface.

#### Post-Application

1. Inspect the result: Check if the film is securely attached and free of bubbles or wrinkles.
2. Dry: Allow the light box to air dry in a ventilated area, avoiding direct sunlight.
3. Clean up: Tidy up the tools and work area.
